The invention relates to inhibiting leucocyte superoxide anion (02-)

production using a naturally occurring proline-arginine (PR)-rich
antimicrobial peptide known as PR-39 and its truncated analogs. The
cuertial comprises contacting leucocytes with the peptide comprising 39 or
comprises contacting leucocytes with the peptide comprising 39 or
comprises contacting leucocytes with the peptide comprising 39 or
complex anion acids, for a time and under conditions effective to inhibit
complex comprises responsible for anion production, by binding to Sirc
complex complex complex. The leucocyte is a mammalian or
cof the phagocytic NADPH oxidase complex. The leucocyte is a mammalian or
cof the phagocytic and the mammalian leucocyte is neutrophil. Another
complex disclosed which employs a PR-39 analog that comprise 16
complex where the sum of the proline and arginine residues in the
complex complex complex complex of amino
complex complex complex complex complex of amino
complex complex complex colls, therefore interfering with the binding
cof p47phox to p22phox. At least 14 or 25% of the amino acid residues in
the peptide are arginine residues. The method of the invention is useful
                                                                                                                                                                                                                         ö

attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, or a neutrophil, to a location, e.g. a wound site. The PR-rich peptides are useful as medicaments to fight infection by attracting leukocytes to a wound site, while restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. The present sequence represents a PR-rich antimicrobial peptide.
                                                                                                                                                                                                                         Gaps

AAW01447-W01454 represent fragments of the proline-arginine rich antimicrobial peptide PR39 (see AAW01446). The PR39 sequence was first isolated from porcine small intestine, and has also been identified in human and porcine neutrophils. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 kills bacteria by interfering with DNA and/or protein synthesis. PR39 kills bacteria by interfering with DNA and/or protein synthesis are important in wound repair, showing that mesenchymal cells. Syndecans are important in wound repair, showing that CPR39 can be used in the method of the invention. The method of the invention is for inhibiting leukocyte superoxide anion (O2-) production. The method comprises administering to a leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte a peptide (such as this sequence) capable of inhibiting leukocyte a conduction. The peptides can be used as medicaments for fighting infection by attracting leukocytes to a wound site and restricting tissue damage at the wound site caused by excessive oxygen radicals produced by these leukocytes. They can also be used to develop products for treating
                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibitor; leukocyte O2- production; proline-arginine rich peptide; pig; antimicrobial peptide; small intestine; human; neutrophil; bacteria; DNA synthesis; protein synthesis; inhibitor; syndecan expression; mesenchymal cell; wound repair; superoxide anion; infection; leukocyte; tissue damage; oxygen radical; inflammatory disease; therapy.
for inhibiting leucocyte oxygen radical production. The peptides are useful as medicaments for fighting infections by attracting leucocytes a wound site, yet restrict tissue damage at the wound site caused by excessive oxygen radicals produced by these leucocytes. The present sequence is PR-39 analog, PR-19.

Sequences AAW75722-W7573 are proline/arginine rich peptides that upon administration into a mammal's bloodstream reduce reperfusion injury (production of reactive oxygen species, neutrophil adherence to endothelium, and extravasation of neutrophils). These peptides have two requirements: they contain the consensus sequence PXXP, where P is a proline residue and X is any amino acid residue, which has been found to inhibit superoxide production, and secondly they have arginine residues of inhibit superoxide production, and secondly they have arginine residues adjacent to these motifs, required for effective inhibition. It was crabilished by structural and function analysis that a peptide should indeally contain 4 or 6 of these motifs, and that inhibitory activity is correlated with the increase of length of peptides. The effectiveness of these peptides was determined by investigating the production of the correlated with the increase of length of peptides. The effectiveness of them to the section of the peptides and also the inhibition of neutrophil chemotaxis. From this, it was found that all of the peptides inhibited considered to section to a liminating or reducing considered in the reperfusion injury induced adhesion and extraction of neutrophils. The peptides are also useful in connection with surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                           Proline; arginine; peptide; reperfusion injury; neutrophil; endothelium; superoxide, neutrophil superoxide anion; chemotaxis; NADPH oxidase; coronary bypass; organ transplantation surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Reduction of reperfusion injury in temporarily occluded blood vessels by administration of a peptide which is rich in proline or arginine

Antimicrobial peptide PR-39 analog PR-26.

20-MAY-2004 (first entry)

```
The present invention relates to a method of inhibiting leukocyte superoxide anion (O2-) production and/or attracting leukocytes. The method comprises the use of proline-arginine (PR)-rich antimicrobial peptides or their truncated analogues. The method is useful for attracting a leukocyte e.g. a mammalian leukocyte, porcine leukocyte, or a neurophil, to a location, e.g. a wound site. The PR-rich peptides are useful as medicaments to fight infection by attracting leukocytes to a wound site, while restricting tissue damage at the wound site caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Attracting leukocyte to location by administering peptide including proline-arginine-rich antimicrobial peptide or its truncated analogs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     excessive oxygen radicals produced by these leukocytes. The present
sequence represents a PR-rich antimicrobial peptide.
                                                                                                                                                                                                                                          peptide;
                                                                                                                                                                                                                        Leukocyte superoxide anion; leukocyte O2- production; leukocyte attraction; proline-argánine-rich antimicrobial peptide PR-rich antimicrobial peptide, neutrophil; wound site; infection; tissue damage; oxygen rádical; antibacterial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 83; DB 8; Length 26;

The invention relates to inhibiting leucocyte superoxide anion (02-)
production using a naturally occurring proline-arginine (PR)-rich
antimicrobial peptide known as PR-39 and its truncated analogs. The
antimicrobial peptide known as PR-39 and its truncated analogs. The
antimicrobial peptide known as PR-39 and its truncated analogs. The
comprises contacting leucocytes with the peptide comprising 39 or
a senion acids, for a time and under conditions effective to inhibit
compared an anon production. The peptide inhibits the activity
compared an anonal production. The peptide inhibits the activity
compared to a NaDPH oxidase complex. The leucocyte is a mammalian or
porcine leucocyte and the mammalian leucocyte is neutrophil. Another
compared is also disclosed which employs a PR-39 analog that comprise 16
amino acids, where the sum of the proline and arginine residues in the
catids. This peptide is at least 66 or 74 % of the total number of amino
cof paptide inhibits leucocyte 0.2 production by the effective
cof paptide are arginine residues. The method of the invention is useful
cof paptide are arginine residues. The method of the invention is useful
considered as medicaments for fighting infections by attracting leucocytes to
a wound site, yet restrict tissue damage at the wound site caused by

This peptide was isolated from the small intestine of a pig. The small inestine is an important endocrine organ and many physiologically active peptides have been isolated from it. This peptide inhibits the growth of, and may kill, bacteria, pref. gram negative bacteria. This peptide or its functional derivatives may be used in human or veterinary medicine for therapeutic or prophylactic use. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                    New anti-bacterial polypeptide - active against Gram negative bacteria.

Bagella L., Scocchi M., Zanetti M.;

"cDA sequences of three sheep myeloid cathelicidins.";

FEBS Lett. 376:225-228(1995).

-:- FUNCTION: Exerts, in vitro, a potent antimicrobial activity.

Probably due to an impairment of the function of the respiratory probably due to an impairment of the function of the respiratory chain and of energy-dependent activities in the inner membrane of susceptible microorganisms (By similarity).

-:- SIMILARITY: Belongs to the cathelicidin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

-!- DOMAIN: The basic amino-terminal Arg/Pro-rich binds heparin and heparan sulfate. Binds collagens type I and type II through its leucine-rich repeat domain.
-!- SIMILARITY: Belongs to the small leucine-rich proteoglycan (SLRP) family. Class II subfamily.
-!- SIMILARITY: Contains 12 leucine-rich (LRR) repeats.

Shi, Jishu

TITLE OF INVENTION: Synthetic Antimicrobial Peptide
NUMBER OF SEQUENCES: 9

CORRESPONDENCE ADDRESS:
ADDRESSE: Hovey, Williams, Timmons & Collins
STREET: 2405 Grand Blvd., Ste. 400

CITY: Kansas City
STATE: Missouri
COUNTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: IBM PC compatible
COMPUTER: ON-Dec-2001

CLASSIFICATION NUMBER: US/10/014,147

FILING DATE: Ot-Dec-2001

PRIOR APPLICATION NUMBER: US/08/930,777A

FILING DATE: October 8, 1997

FILING DATE: October 8, 1997

FILING DATE: APPLI 10, 1996

ATTORNEY/AGENT INFORMATION:
NAME: COLIINS, John M.
REGIERRICE/DOCKET NUMBER: 26,262

REFERENCE/DOCKET NUMBER: 26,262

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 6, Application US/10391155
Publication No. US20040009463A1
GENERAL INFORMATION: Michael
APPLICANT: Simons, Michael
Gao, Youhe
TITLE OF INVENTION: Method for PR-39 peptide mediated
selective inhibition of IKBA degradation
NUMBER OF SEQUENCES: 6
Sequence 2, Application US/10391155
Publication No. US20040009463A1
GENERAL INFORMATION:
APPLICANT: Simons, Michael
Gao, Youhe
TITLE OF INVENTION:
Belective inhibition of IKBA degradation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COMPUTER EADABLE FORM:
